CP-004 — BrewCore Legacy Compatibility Guide Rev.4

Document ID: CP-004

Revision: 4

Authority Class: MANUFACTURER_TECHNICAL

Status: Current

Purpose

Provides legacy-equipment guidance for BrewCore migration and reuse decisions. It does not establish customer ownership; installed or purchase history must come from authoritative business data.

BC-700 Migration

BrewCore BC-700 is discontinued. BC-920 may be considered as a current high-volume replacement candidate when customer requirements and site conditions support it. Replacement candidacy does not imply that all BC-700 accessories or supporting equipment remain compatible.

WF-250 with BC-920

AquaPure WF-250 + BrewCore BC-920 = CONDITIONAL. Approved migration requires BrewCore CK-25 legacy water-interface conversion kit and all other applicable technical conditions. This relationship is not DIRECT and must not be represented as a simple REPLACE relationship.

Legacy Module MB-70

BrewCore MB-70 is not supported with BC-920. Ownership of MB-70 does not establish reuse compatibility.

Evidence Boundary

CP-001 governs the detailed AquaPure-to-BrewCore water-treatment compatibility matrix. Any production-specific BrewCore water-connection requirement in TB-003 must also be evaluated where applicable.

Unknown Configuration

If production identifier, machine-side connection, installed accessory, or another material compatibility dependency is unknown, compatibility remains unconfirmed until the required evidence is obtained.
