BREWCORE LEGACY COMPATIBILITY GUIDE

Installed-Base Reuse and Upgrade Relationships

Field	Value	Field	Value
Document ID	CP-004	Revision	4
Effective Date	1 January 2026	Status	Current
Document Type	Legacy Compatibility Guide	Product Family	BrewCore Espresso Systems

1. Purpose and Scope

Defines supported reuse and upgrade relationships between selected legacy BrewCore installations (BC-600, BC-700, BC-750) and current BC Series equipment. Existing infrastructure and components must not be assumed reusable simply because they remain installed.

2. Legacy Reuse Status

Status	Meaning
REUSABLE	May be retained where condition and site requirements remain acceptable.
CONDITIONAL	Reuse supported only after stated conditions or conversion are satisfied.
REPLACE	Not approved for reuse in the stated configuration.
INSPECT	Potentially reusable infrastructure requiring site inspection or measurement.
NOT LISTED	No reuse determination established.

3. Legacy Machines

Legacy Model	Configuration	Typical Installed Period	Status
BC-600	2-group commercial	2014-2017	Legacy
BC-700	2-group commercial	2017-2020	Legacy
BC-750	2-group enhanced commercial	2019-2022	Legacy

4. Legacy Installation Reuse Matrix

Existing Component	BC-820	BC-920	BC-980	BC-1100
WF-250 treatment	CONDITIONAL	REPLACE	REPLACE	REPLACE
WF-300 treatment	CONDITIONAL	CONDITIONAL	REPLACE	REPLACE
Existing 3/8" water connection	CONDITIONAL	CONDITIONAL	REPLACE	REPLACE
Existing 1/2" water connection	INSPECT	INSPECT	INSPECT	INSPECT
Existing drainage	INSPECT	INSPECT	INSPECT	INSPECT
Existing electrical circuit	INSPECT	INSPECT	INSPECT	INSPECT
Existing counter/worktop	INSPECT	INSPECT	INSPECT	INSPECT
Legacy machine power cable	REPLACE	REPLACE	REPLACE	REPLACE
Legacy proprietary control accessory	REPLACE	REPLACE	REPLACE	REPLACE

5. Water-Treatment Reuse

WF-250 may be considered for BC-820 only where CP-001 conditions are satisfied. WF-300 may be considered for BC-820 and BC-920 subject to CP-001, adapter requirements, system condition, flow, pressure, cartridge condition, and any production-specific BC-920 requirement.

6. Infrastructure vs Component

Building electrical circuits, water lines, drains, counters, and service space are infrastructure and generally require inspection against the new equipment requirement. Treatment systems, adapters, accessories, and machine-specific modules are components and generally require explicit compatibility evidence.

7. Historical Success Is Not Compatibility Evidence

> **A configuration that worked with a legacy machine does not establish compatibility with the replacement machine.**

For example, successful BC-700 + WF-300 operation does not establish BC-980 + WF-300 support.

8. Condition and Compatibility

A technically compatible component may still be unsuitable for reuse because of wear, corrosion, contamination, damage, exhausted media, poor maintenance, or unacceptable condition. Compatible does not mean reuse recommended.

9. Upgrade Assessment Workflow

- Identify existing machine.
- Qualify current operating requirement.
- Select candidate current equipment.
- Inventory infrastructure and components.
- Identify exact models/part numbers.
- Retrieve explicit compatibility evidence.
- Inspect infrastructure.
- Verify technical bulletins.
- Separate reusable, conditional, and replacement items.
- State unresolved information before proposing the final configuration.

10. Related Documentation

- PT-003 - BrewCore BC Series Product Catalog

Compatibility applies only to documented relationships and stated conditions. Physical fit or specification similarity is not a substitute for controlled compatibility evidence.
